## SAFE HOISTING PRACTICES

### YALE ELECTRIC HOIST

For your own safety and that of your fellow workers, Material Handling Equipment must be used as recommended by the Manufacturer. Failure to heed the following recommendations could endanger your life. Use good common sense and judgment at all times. Safety is the responsibility of the operator of the equipment. You must be competent and attempt to foresee and avoid all hazardous conditions. To be safe as possible, the hoist must be given proper preventative maintenance and testing as described in the ANSI B30-16 Safety Code for Overhead Hoists and this manual.

#### BEFORE OPERATING HOIST:

1. Do not operate hoist unless you are properly trained, physically fit, and authorized to do so. You must be familiar with all operating controls of the hoist, warnings and instructions on the hoist, the safe hoisting practices listed in this bulletin, ANSI B30-16 Safety Code for Overhead Hoists, and all pertinent Federal, State, and local regulations before beginning operation.
2. Do not allow unqualified personnel to operate the hoist.
3. On powered hoists, test all controls and limit switches and make sure hoist is well lubricated at beginning of each shift. Make sure needed lubrication, adjustments or repairs are made by appointed personnel before operations are begun.
4. Be familiar with the equipment and its proper care. Do not operate hoist if adjustments or repairs are necessary, if any damage or undue wear is known or suspected, or if any warnings, operating, or capacity instructions normally attached to hoist are obscured, damaged or missing. Report same promptly to the proper person and also notify next operator when changing shifts.
5. Do not operate hoist if it is functioning improperly.
6. Do not operate hoist with an out-of-order sign attached until sign has been removed by a properly authorized person.
7. Do not adjust or repair hoist unless qualified for maintenance of hoist.
8. On powered hoists, be sure the power supply is disconnected before maintenance and repair procedure is performed.
9. Do not use the chain or rope as a ground for welding.
10. Do not touch a welding electrode to the chain or rope.

## APPLYING THE LOAD:

11. Never wrap the hoist rope or chain around the load, or allow it to drag under load.
12. Always use slings or other approved devices to attach load.
13. Be sure the sling is properly seated in the saddle of the hook. Do not allow hook latch to support any part of load.
14. Do not apply a load to tip of hook, or in such a way as to cause bending or prying forces on the hook or hook support block.
15. Be sure chains or wire ropes are not kinked or twisted or that multiple part chains or ropes are not twisted about each other.
16. Do not operate hoist if wire rope or chain is not seated properly in the grooves of the drum, sheaves or sprockets.
17. On wire rope hoists, do not load hoist with less than two wraps of rope on the drum, unless a lower limit device is provided, in which case, no less than one wrap shall remain on drum.
18. Center hoist unit over the load before lifting. Avoid side pull.
19. Never pick up a load beyond the rated capacity appearing on the hoist, except for properly authorized tests.
20. Do not use the load limiting device to measure the maximum load to be lifted; it is a safety device only.

## MOVING THE LOAD:

21. Do not engage in any activity which will divert your attention while operating hoist.
22. Respond to signals from designated personnel only, except for stop signals.
23. Never lift a load with the hoist until you and all other personnel are clear of load.
24. Make sure a load clears neighboring stock piles or machinery before moving.
25. On powered hoists, inch the hoist slowly into engagement with a load, but avoid excessive plugging, inching, and quick reversals of load.
26. Do not lift load more than a few inches until it is well balanced in the sling or lifting device.

**When Replacement Parts Are Needed, Order Only Yale® Factory Engineered Parts**

# Yale® Hoists

27. Each time a load approaching rated capacity is handled, check load brake action by raising load just clear of supports and continuing only after you are sure brake is operating properly.
28. Do not transport load over personnel.
29. Never carry personnel on the hook or the load.
30. Avoid swinging of load or load hook when traveling the hoist.
31. On trolley mounted hoists, avoid sharp contact between trolleys, or between trolleys and rail stops.
32. On powered hoists, do not use limit devices as a normal means of stopping the hoist. These are emergency devices only.
33. On powered hoists, do not exceed the maximum duty cycle specified by the manufacturer.

## PARKING:

34. Do not leave a load suspended in the air for extended or unattended periods.
35. On powered hoists, keep load block above head level when not in use.

## SAFETY LAW FOR PASSENGER ELEVATORS

The safety laws for passenger elevators specify construction details that are not necessarily incorporated in Yale Hoists. We recommend that passenger elevator operation equipment be used that meets all state and national safety codes. Yale Hoists will not accept responsibility for applications of Yale hoists on passenger elevators.

## INSPECTION PREVENTIVE MAINTENANCE AND TESTING

A preventive maintenance program should be initiated for the hoist immediately after it is entered into service. The preventive maintenance program should comply with recommendations in the applicable Yale parts and instructional manual, and all pertinent Federal, State, and local regulations and written inspection records kept as specified. Sample inspection check lists are included at back of this manual. Extra inspection check lists can be obtained from your nearest authorized Yale Hoists Distributor.

## REPAIR PARTS ORDERING INFORMATION

This Parts and Instruction manual is provided as a convenience to assist you in ordering repair parts for your YALE KEL Series Electric Hoist. To insure prompt service, place all parts orders with your local distributor.

Give all information listed below in items a, b, c, d, and e. This will enable your distributor to fill your order promptly.

- a. Give complete date from hoist nameplate.
- b. Give part numbers, description and quantity required.
- c. Give the correct shipping destination.
- d. For ordering motor repair parts, give all data on the hoist and motor nameplates.
- e. For motorized trolleys give complete trolley serial number.

If it becomes necessary to return the complete hoist or certain parts to the factory, a letter requesting such a return is necessary. This letter should contain an explanation for requesting the return. A return authorization will be issued giving you clearance for returning the hoist or parts to the factory. Should you need additional help in ordering, contact your local YALE distributor.

## INSTALLATION INSTRUCTIONS

### GEAR CASE VENT

Before hanging the hoist, remove the vinyl plug at the top of the unit with the tag attached. The plug was to prevent oil leakage during shipment and must be removed to prevent oil leaks due to pressure build-up. Check the oil level at the level plug on the side of the unit. See lubrication chart on page 15.

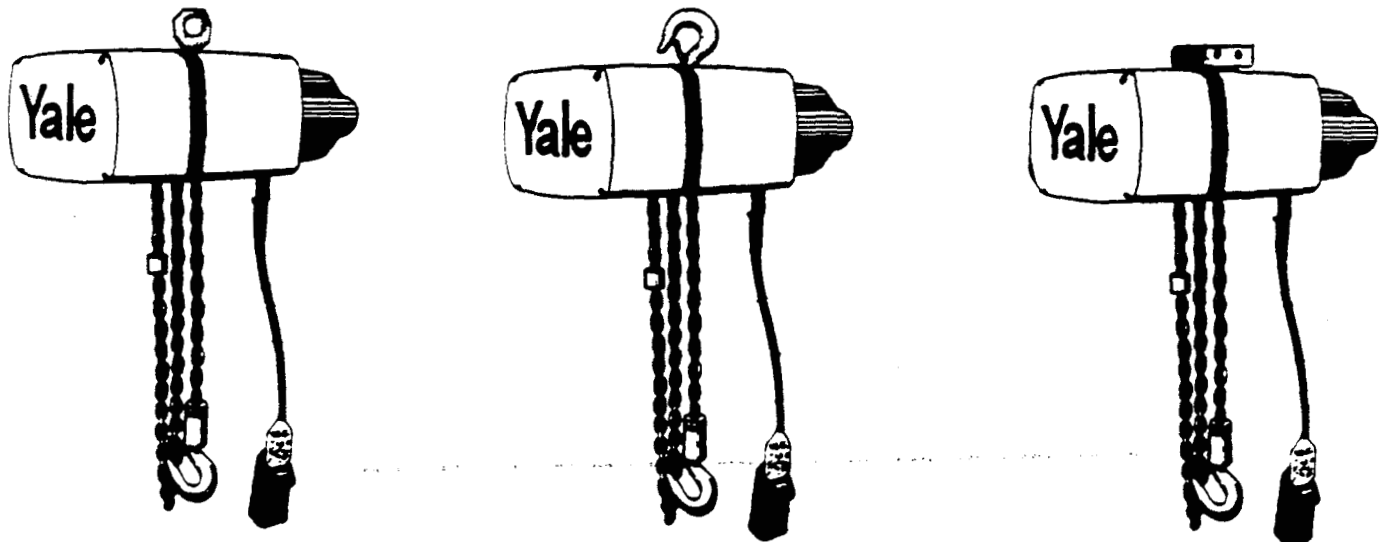

### CHAIN LUBRICATION

The load chain is the only component requiring lubrication prior to putting the hoist in operation. See lubrication chart on page 15.

### BASIS SUSPENSION

The basic hoist suspensions are hook, clevis, and lug as shown in Figure 2 below. Unless otherwise specified, the suspensions will be Rigid (non-rotating) types, other types are available. The lug suspension is rigid (non-rotating), and adjustable in 90 degree increments. If it is necessary to reposition the lug, refer to Pages 31, 32, and 33 ASSEMBLY PROCEDURE.

 **CAUTION** FOR MAXIMUM SAFETY, ALL FASTENERS HAVE A LOCKING FEATURE. BE CERTAIN ALL LOCKING DEVICES ARE REPLACED WHEN REASSEMBLING.

## TROLLEY SUSPENSION

Standard trolley suspensions are plain, and hand geared (not shown).

PLAIN TROLLEY TYPE

RT TROLLEY TYPE

"ST" and "TT" (not shown) powered trolleys are also available. If the hoist is equipped with an ST trolley, refer to page 73 thru 77 for service information. If TT trolley is used, see separate TT parts manual.

**NOTE:** If your hoist is furnished with an ST trolley, record the serial number in this book for future reference.

To hand hoist furnished with plain, geared, or motorized trolley, first determine the beam size on which the trolley is to be used, then refer to trolley adjustment page 8 for proper spacer arrangement.

## TROLLEY ADJUSTMENT

All Yale trolleys are normally properly adjusted at the factory to fit I-Beam size stated on the order.

**NOTE:** When disassembling the trolley for installation on the I-Beam, take note of the arrangement of the spacers and washers for correct reassembly.

For installation on I-Beam other than the size preset at the factory, or if final adjustment to beam is required, follow the instructions below:

Measure the I-Beam flange width and temporarily install the trolley sideplates on the hoist before installation to determine the exact distribution of washers.

The distance between track wheel flanges should be  $3/16$  inch greater than the beam flange width for straight runway beams, or  $3/16$  to  $1/4$  inch on runway systems that include sharp curves. To keep the hoist centered under the I-Beam, the number of washers between the sideplates and the hoist lug should be the same, or differ only by one washer. The distribution of washers outside the trolley sideplates is unimportant except that the total number used must be sufficient to keep the nuts engaged.

**NOTE:** When installing hoist and trolley on beam, tighten nuts to 175 ft. lbs. torque so that the trolley sideplates are parallel and vertical.

**CAUTION** BE SURE THERE IS A LOCKWASHER UNDER EACH NUT.

Center the trolley on the beam, and check the clearance between the wheel flange and beam flange. If the trolley is adjusted properly, this clearance will be  $3/32$ " to  $1/8$ ".

## FUNCTION TESTING OF TROLLEY

After the hoist and trolley are installed on the I-Beam, operate the trolley over the entire length of the beam with a capacity load to be sure that adjustment and operation is satisfactory.

## OPERATING INSTRUCTIONS

For your own safety and that of your fellow workers, Material Handling Equipment must be used as recommended by the manufacturer. Failure to heed the safe hoisting practices spelled out on pages 2 through 4 could endanger your life. Read them carefully.

## POWER CONNECTIONS

 **CAUTION** BEFORE CONNECTING POWER TO THE HOIST, BE SURE THE POWER SUPPLY CORRESPONDS TO THE HOIST RATING.

To determine hoist rating or to change rating on units equipped with dual voltage connection, remove the large control cover at the end of the hoist to expose dual voltage terminal strip. Voltage setting is determined by location of the terminal connections in a vertical column on either the high or low voltage side of the terminal strip. To change voltage, simply move the wires to the opposite side of the terminal strip to the identically numbered terminals. Before replacing cover, check for bent terminals, and make sure all connections are tight.

 **CAUTION** CHECK FOR CORRECT PHASING.

On poly phase A.C. hoist, it is impossible to know how to connect the power line for correct direction of the hook travel. If the hook does not travel up when the "up" button is depressed, interchange two of the line wires for three phase, and two of the line wires of any one phase for two phase operation.

 **CAUTION** DO NOT REWIRE THE PUSH BUTTON.

## TRAVEL LIMITS

The KEL chain hoist is equipped with a load limiting clutch to help prevent damage to the hoist which could be caused by loading the hook above 175% of rated load or overrunning the extremities of the chain. The stops attached to the chain provide a positive stop against the bottom steel crosshead in the event the usable length of the chain is overrun. The chain stop at the housing end of the chain may be repositioned further away from the chain end to further limit hook drop.

 **CAUTION** NEVER REMOVE THE STOP AT HOUSING END OF CHAIN OR POSITION IT CLOSER THAN EIGHT LINKS FROM THE END OF THE CHAIN.

The optional chain stop near the load hook (single line models only) may be repositioned as desired to limit lift, or may be removed. A clutching noise may be heard when operating the hoist against the stops. This indicates the unit is in a dangerously overloaded or stalled condition.

 **CAUTION** DO NOT USE THE LIMIT CLUTCH AS A REGULAR MEANS OF STOPPING THE HOOK AT EXTREMITIES OF TRAVEL OR AS A REGULAR MEANS OF MEASURING THE MAXIMUM LOAD TO BE LIFTED. THIS IS A SAFETY BACKUP DEVICE ONLY.

The load limiting clutch is a friction device, and therefore susceptible to overheating and wear. For optimum performance and long life, RELEASE THE PUSHBUTTON IMMEDIATELY WHEN THE CLUTCH SLIPS.

## PREVENTIVE MAINTENANCE

### PREVENTIVE MAINTENANCE SCHEDULE

The periods between inspections will vary due to the wide range of duty cycles and operating conditions encountered with this type of equipment. The following inspection periods are based on average duty with single shift operation (40 hours per week) under normal environmental conditions. If the hoist is used in heavier applications or under adverse environmental conditions, it should be inspected more frequently.

### DAILY INSPECTION

Inspect the following items before operating hoist.

1. Controls: Check all controls and operating mechanisms for improper operation.
2. Limit Clutch: Check limit clutch for improper operation. Testing shall be done under no load conditions. Run the upper and lower chain stops into the hoist at slow speed. A clutching noise may be heard when operating the hoist against the stops. This is normal in an overloaded or stalled condition.
3. Electrical Connections: Check for worn or frayed wires or loose connections.
4. Hooks: Check for cracks or deformation. The bottom hook must swivel freely. Check for damaged or missing safety latch. A bent or twisted hook indicates overloading or abuse of the unit. Other load bearing components of the hoist or trolley should be inspected if overloading is apparent or suspected.
5. Chain: Check for nicks, gouges, corrosion, twist, and distorted links.
6. Unusual Conditions: Excessive noise, oil leaks, etc. should be investigated.

**CAUTION DO NOT OPERATE THE HOIST IF IT IS FUNCTIONING IMPROPERLY OR DAMAGE IS NOTED.**

### MONTHLY INSPECTION

1. All items under daily inspection.
2. Chain: If chain binds, jumps, or is noisy, check for cleanliness and proper lubrication. If trouble persists, inspect chain for wear and stretch. See page 13.
3. Hooks: Replace hooks if the throat opening is in excess of maximum shown in table 1, page 14, or if there is 10 degree or more twist from normal plane of hook. Check hook retaining nuts or collars and means used to secure them.
4. Driving and Idler Pocket wheels and Sprockets: Pocket Wheels and sprockets which are worn should be replaced, as they can greatly reduce the life of the hoisting chain.
5. Electrical Parts: Check for signs of contactor pitting and/or deterioration of controls.

**When Replacement Parts Are Needed, Order Only Yale® Factory Engineered Parts**

# Yale® Hoists

6. Load Brake: Check the function of the load brake by lifting a light load, disconnecting electrical power, removing the control cover, and manually opening the motor brake. The load may "creep" slowly while the motor brake is held open. This is normal. However, if the load falls to the floor the instant the motor brake is released, the load brake is not functioning and should be repaired. Replace the load brake assembly 6438664-00. See Item 5 under RECOMMENDED SEQUENCE OF DISASSEMBLY, Page 25.
7. Check all bearings for noisy operation, which is an indication of wear.
8. Pushbutton: Check the ground connections to be sure that the wire cores from the pushbutton cable and the power cord are secured. Tighten the grounding screw, replace the lockwasher if it is missing.
9. Load Brake Backlash: With no load on the hoist, check the backlash in the load brake by pulling on both the hook side and dead end side of the chain. If the amount of "free chain" that can be pulled back and forth through the hoist exceeds two full links, the backlash is excessive. Disassemble hoist per Item 5 page 25, and check load brake disc wear. Replace load brake assembly 6438664-00 if discs are less than 1/16" thick. Adjust the brake backlash per note in item 1(d) page 26 during reassembly.
10. LUBRICANT: Check the condition and level of the lubricant. The lubricant should be clear in color. Black color indicates a chemical change in the lubricant caused by excessive heat from the load brake which is in turn caused by heavy duty cycles. Lubricant that is black in color must be replaced to prevent shortened life of drive components. If the level is low, check for leaks. Replace gaskets and seals as required. Lubricant chain and other points as required. (See chart on page 15.)

**CAUTION FOR OPTIMUM LUBRICATION AND LOAD BRAKE COOLING, OIL LEVEL MUST BE MAINTAINED AT THE LEVEL PLUG.**

11. Warning Labels: Check for absence or illegibility of required warning labels and tags, and replace as necessary.
12. Supporting Structure or Trolley: If used, should be checked for continued ability to support the imposed loads. Check for loose suspension or support bolts, axle nuts, etc.
13. Hardware: Check for loose bolts, nuts, and rivets.
14. Inspection Check List: Fill out inspection check list at back of this manual, sign, date, and file for future reference.

## ANNUAL INSPECTION

1. All items under daily and monthly inspection.
2. Hooks: Magnetic particle or other suitable crack detecting inspection should be performed if need is indicated by external appearance. Check for loose retaining nuts and collars.

**When Replacement Parts Are Needed, Order Only Yale® Factory Engineered Parts**

# Yale® Hoists

3. Load Bearing Parts: Check for worn, cracked, or distorted parts such as hook blocks, suspension housing, outriggers, clevises, yokes, suspension bolts, shafts, locking devices and bearings on hoist. (Also on trolley, if so equipped.)
4. Motor Brake: Check motor brake for worn discs and excessive play between the splines in the discs and the brake hub. If either disc is worn  $1/16"$  or more replace both discs. The new disc measures  $3/16"$ . Check adjustment as shown in Figure 4 below. Clean the solenoid plunger seat and check for even seating between the plunger and coil.
5. Load Limiting Device: Check load limiting device with 175% of rated load. If load can be lifted, the load limiting device must be replaced.

**CAUTION: PRIOR TO TESTING ALL SUPPORTING STRUCTURES, ANCHORAGES, AND/OR SUSPENSIONS MUST BE APPROVED BY THE APPOINTED PERSON FOR THE TEST LOADS USED.**

FIGURE 4.  
MOTOR BRAKE

6. Wiring and Terminals: See that all connections are tight. Terminals are to be securely crimped to wires and the insulation sound. Bent terminals can usually be straightened to provide a tight fit. Replace terminals or wire if necessary.
7. Load Chain: Carefully inspect the chain for wear between the links in the section of chain that most often passes over the pocket wheel. Check several links, as wear is seldom even from one link to another. See instructions on page 13 and on pages 19, 20, and 21.

**When Replacement Parts Are Needed, Order Only Yale® Factory Engineered Parts**

# Yale® Hoists

9. Chain Guide and Pocket Wheel: If the load chain is worn or stretched and requires replacing, also examine the pocket wheel and load chain guide and stripper. If these parts are worn they should be replaced to avoid damaging the new load chain and jamming of the chain. New link chain should be installed with weld on vertical link as shown in Figure 5, page 19.

**CAUTION** THE CHAIN MUST BE REPLACED IF WEAR HAS INCREASED THE SPECIFIED GAGE LENGTH BEYOND THE MAXIMUM GIVEN IN TABLE BELOW. THE GAGE LENGTH SHOULD BE CHECKED ON PORTION OF CHAIN THAT NORMALLY PASSES OVER THE POCKET WHEEL, AND WITH A LOAD ON THE HOOK.

LINK CHAIN NOTE: OTHER CHAINS MARKED Y5 ARE ALSO ACCEPTABLE

**WARNING**

**WARNING** WHEN REPLACING LOAD CHAIN, USE ONLY CHAIN STAMPED Y\*-1K OR Y1-1K. FOR PART NUMBER SEE ITEM 21, PAGE 42. INSTALL PER INSTRUCTIONS ON PAGE 19. ALWAYS REPLACE END PINS WHEN REPLACING CHAIN. SEE FOLLOWING PART NUMBERS FOR PINS:  
 1/2 TON - 6428951-00, 1 TON - 6428961-00,  
 2 TON - 6429353-00 AND 3 TON - 6401549-07  
 (SHOULDER BOLT). ALSO CHECK PIN SUPPORT HOLES IN BOTTOM BLOCK CASTINGS AND REPLACE CASTINGS IF HOLES ARE WORN.

10. Inspection Check List: Fill out inspection check list at back of this manual, sign, date, and file for future reference.

**NOTE: INSPECTION RECORD**

The last pages of this manual are inspection check lists to be filled out and signed by the person making the monthly or annual inspections.

## FUNCTION TESTING

After repair of hoist, test with a light load for proper function. This hoist is equipped with a load limiting device. Load test unit with 100% of rated load, and check load limiting device with 175% of rated load. See item 5 of annual inspection instructions. If the gear train has been disassembled, check the load brake per item 6 of the monthly inspection instructions. (If no load bearing parts were repaired or altered, a normal load lifted may be used for test, and test of load limiting device may be omitted). A written report of the test should be prepared by the person responsible and kept for future reference.

 **CAUTION** PRIOR TO TESTING, ALL SUPPORTING STRUCTURES, ANCHORAGES, AND/OR SUSPENSIONS MUST BE APPROVED BY THE APPOINTED PERSON FOR THE TEST LOADS USED.

### INSTRUCTIONS FOR INSTALLING NEW CHAIN

**⚠ CAUTION DO NOT REMOVE THE OLD CHAIN FROM THE HOIST; THIS IS THE LAST STEP.**

(a) For 1/2 and 1 Ton Units: Remove the socket head screw from the bottom block. Remove bolt from chain dead end at lower crosshead. Remove chain stop.

For 2 Ton Units: Remove socket head suspension screw holding anchor block, drive out anchor pin. Pull chain through bottom block. Remove bolt from chain dead end at lower crosshead. Remove chain stop.

For 3 Ton Units: Remove shoulder screw in top of bottom block. Pull chain through idler pocket wheel and bottom block. Remove bolt from dead end at lower crosshead. Remove chain stop.

(b) Cut a link from the end of the old chain WITHOUT REMOVING THE CHAIN FROM THE HOIST.

FIGURE 5.

(c) Notch the links as shown in the illustration above being careful not to distort it in any way. It must pass over the pocket wheel without binding. The chain is hard. An abrasive wheel will be needed to cut it.

(d) Lubricate the new chain per instructions and lubrication chart on page 15.

(e) Connect the new chain to the old using the notched link. Be sure the welds of the standing links (links turned perpendicular to the sheave) face away from the driving pocket wheel. On 1/2, 1 and 2-ton units the first link of the new chain must go on flat. On 3 ton units first link of new chain must go on standing. Use 2 notched links if necessary. (See figure 5 above and figure 6 on page 20.)

- (f) Carefully energize the hoist, paying off the old chain and feeding on the new chain.
- (g) For 1/2 and 1 Ton Units: Assemble chain to bottom block with socket head screw and retaining band. Replace chain stop at least 8 links from dead end of chain. Fasten dead end to lower crosshead. Do not twist chain.

For 2 Ton units: Work chain over bottom block pocket wheel with the chain welds on "Standing Links" toward the pocket wheel. Start with "Flat" link and be sure chain is not twisted. Install chain end to anchor block with anchor pin. BE SURE CHAIN IS NOT TWISTED. Install anchor block to hoist with socket head suspension screw, be sure the top lip of anchor block extends past end of bottom crosshead. Socket head screw must be torqued to 40-50 Ft. Lbs. Replace chain stop at least 8 links from dead end of chain. Fasten dead end of chain to bottom crosshead. Be sure chain is not twisted.

For 3 Ton Units: Work chain over bottom block pocket wheel with the chain welds on "Standing Links" toward the pocket wheel. Start with "Standing Link." Be sure chain is not twisted. Work chain over idler pocket wheel from side away from center line of hoist. Chain welds on "Standing Links" must be toward the pocket wheel. Start with "Standing Lin." BE SURE CHAIN IS NOT TWISTED. Pull end through the fasten to top of bottom block with shoulder screw. Be sure chain is not twisted. Replace chain stop at least 8 links from dead end of chain. Fasten dead end to bottom crosshead. ## 1. RECOMMENDED SEQUENCE OF DISASSEMBLY

Before doing any maintenance work on the hoist read the following instructions thoroughly. Refer to the replacement parts section for part identification.

TO COMPLETELY DISASSEMBLE THE HOIST: Follow the disassembly procedures in the order listed.

TO DISASSEMBLY ANY ONE SPECIFIC PART OF THE HOIST: Follow the instructions for that specific section.

- (a) Disconnect the dead end of the chain from the hoist (both ends on 2 & 3 ton models), and remove the chain stop.
- (b) Run the hoist in the lowering direction to remove the chain. If power was disconnected before the chain was removed, wait until step (v) to remove chain.
- (c) If it is necessary to separate the bottom block from the chain, on the 1/2 and 1 ton hoists, remove the socket head screw from the block. On 2 ton models, simply pull the chain through the block. On 3 ton models, remove the shoulder screw at the top of the bottom block and pull the chain through the idler Pocket Wheel and bottom block.
- (d) If it is necessary to remove the hook from the block. On the 1/2 and 1 ton hoists, remove the socket head screw and the retainer band. On 2 and 3 ton models, remove the two (2) 3/8 inch hex head bolts and separate the block halves. Drive out the roll pin, unscrew the hook nut, and remove bearing.

**CAUTION** BEFORE CONTINUING FURTHER WITH THE DISASSEMBLY PROCEDURES, CUT OFF ALL POWER TO THE HOIST BY DISCONNECTING THE POWER FEED LINE.

- (e) The hoist should now be removed, if possible, from the working area and placed on a maintenance bench for further disassembly.

**CAUTION** NEVER DISASSEMBLE THE HOIST IN DIRTY SURROUNDINGS, NOR ALLOW DIRT, GRIT OR ANY OTHER FOREIGN MATERIAL TO GET ON THE WORKING PARTS OF THE HOIST OR INTO THE WORKING AREAS OF THESE PARTS.

- (f) Drain the oil from the hoist by removing the 1/2 inch hex socket drain plug from the bottom of the gear case.

**NOTE:** A convenient way to hold the unit for disassembly is to invert the unit and clamp the top hook or suspension lug in a vise.

- (g) Loosen the four (4) slotted 10-24 control cover screws and remove the control cover.

**When Replacement Parts Are Needed, Order Only Yale® Factory Engineered Parts**

# Yale® Hoists

- (h) Remove the seven (7) 8-32 hex head nameplate-access cover screws and cover.
- (i) Disconnect the motor leads from the terminal block and contactor. See the wiring diagram on pages 87 through 105.
- (j) Disconnect the power cord and control cord leads from the terminal block, contactor and transformer.
- (k) Loosen the hex nut on the power cord and control cord strain relievers, and disconnect the support cable. Remove the cords from the hoist.
- (l) Disconnect the motor brake solenoid leads and remove the contactor, transformer, terminal block and motor brake assembly from the hoist. DO NOT REMOVE THE SPLINED BRAKE DISC DRIVE BLOCK AT THIS TIME. (When replacing torque brake screws to 50/60 in. lbs. Contactor, Terminal Block & Transformer screws to 25/30 in./lbs.)
- (m) Remove the four (4) 10-32 hex head thru-bolts from the end of the motor and carefully remove the motor strator being careful not to damage the motor leads when pulling them through the housing.
- (n) Remove the motor rotor and shaft. The bearing and coupling sleeve should come out with the motor shaft; if not, remove the bearing and sleeve next.
- (o) Remove the (6) 1/4-20 hex head screws from the gear case cover and carefully pull the cover back together with the pinion shaft. (If the gear case cover oil seal is to be re-used, it is important that the shaft and cover be pulled together to prevent damage to the seal). As the shaft is removed, it must pass through a second oil seal in the end of the sheave shaft. Keep the shaft straight and centered in the sheave shaft until it is free of the hoist. If the cover gasket is not torn or otherwise damaged, it may be re-used. (When replacing cover torque screws to 115 to 125 in. lbs.)
- (p) Remove the retaining ring and brake drive block from the pinion shaft. If the gear case cover oil seal is to be re-used, cover the shaft serration with tape or some other means before pulling the shaft through the seal.
- (q) Remove the retaining ring of the first reduction gear and pull off the gear.
- (r) Remove the three (3) 10-24 hex head bearing retaining screws and pull out the second reduction pinion.

**When Replacement Parts Are Needed, Order Only Yale® Factory Engineered Parts**

# Yale® Hoists

- (s) Remove the two (2) allen screws locking the sheave shaft nut, and remove the nut (left hand thread). All shaft components will now slide off.
- (t) Do not disassemble the load brake assembly. This is a Factory Assembly. Individual spare parts cannot be obtained separately. See page 41 Item 24 for further information.
- (u) Do not disassemble the load limiting clutch and second reduction gear assembly. This is a factory calibrated unit that may be damaged if disassembled. Parts for the clutch assembly cannot be obtained separately. See page 41 Item 22 for detailed information.
- (v) If the chain was not removed from the hoist at step (b), remove it now by turning the sheave shaft by hand and feeding the shortest end of the chain straight into the guide.
- (w) Remove the two (2) allen socket head suspension bolts, and the top and bottom crossheads. (See Pages 27 thru 33 for Reassembly).
- (x) Remove the three (3) 1/4-20 hex head sheave shaft bearing retaining screws. Pull the chain guide halves out of the housing far enough to retract the stripper from the sheave then pull the sheave shaft from the housing being careful not to damage the oil seal if it is to be reused. The chain guide halves can now be removed from the housing.
- (y) This completes the disassembly. UNDER NO CIRCUMSTANCES SHOULD THE THREE (3) TEMPER PROOF SCREWS THAT JOIN THE HOUSING HALVES BE REMOVED. The halves mate with an interference fit and were permanently joined by a hydraulic press before machining. If the halves are separated, the dimensional accuracy of the housing will be destroyed.

## 2. TO REMOVE THE MOTOR

- (a) Cut off all power to the hoist by disconnecting the power feed line.
- (b) Do not allow dirt, grit or any other foreign material to get on the working parts of the hoist or into the working areas of these parts.
- (c) Follow steps (e), (g), (h), (i), (m), and (n) under RECOMMENDED SEQUENCE OF DISASSEMBLY.

## 3. TO REMOVE THE MOTOR BRAKE

- (a) Follow steps (a) and (b) above and steps (e) and (g) under RECOMMENDED SEQUENCE OF DISASSEMBLY.

- (c) Drive out roll pin that locks pocket wheel and axle.
- (d) Remove both retaining rings that lock bearings in position.
- (e) Drive sheave axle out from crosshead.

## 1. REASSEMBLY

- (a) Reverse the procedure for disassembly replacing all worn or damaged parts.
- (b) First install the pocket wheel shaft and chain guide halves. Then the top and bottom crossheads. (See pages 27 through 33 for crosshead assembly.)
- (c) As in disassembly, invert the unit and clamp the top hook or lug in a vise.
- (d) With the unit inverted, feed the chain straight into the guide rotating the pocket wheel shaft by hand. Be sure that the welds of the "standing" links face away from the pocket wheel. See page 19.  
IMPORTANT: When installing the left-hand threaded retaining nut at the end of the pocket wheel shaft, be sure the output gear-clutch assembly is screwed all the way onto the shaft to allow the nut to bottom on the shaft shoulder. Back off the nut as little as possible to line up the locking screw holes.

**CAUTION BE SURE THE TWO (2) LOCKING SCREWS HAVE LOCK WASHERS.**

When the nut is adjusted properly, the output gear will rotate independently of the chain sheave through an arc not exceeding three gear teeth.

- (f) Be sure all fasteners have lockwashers.
- (g) Remember: Oil seals are delicate, easily distorted in installation and easily cut by shaft serrations and burrs. Cover serrations and lubricate seals when assembling.
- (h) See the PREVENTIVE MAINTENANCE SCHEDULE section for proper motor brake adjustment.
- (i) Be sure to replace the chain stop before operating the hoist. THE CHAIN STOP ON THE DEAD END OF THE CHAIN MUST BE AT LEAST EIGHT (8) LINKS FROM THE CHAIN END.
- (j) Fill gear case to level plug only with lubricant specified under "LUBRICATION, page 15.

## AC REVERSING CONTACTORS TYPES R0-1, R0-4, & R0-10

**Contacts** - are not harmed by discoloration and slight pitting. Do not file them as dressing only wastes contact material. Replacement is required only when the contact has worn thin.

**Contact inspection** - Disconnect electrical power and remove all power wiring. Make note of the connections so they may be reconnected correctly. Remove the stationary contact assembly (item 1) by loosening mounting screws (2) to expose the stationary and movable contacts. Movable contact finger (3) is removed by pulling straight out. Stationary contacts of newer contactors and of replacement kits are stated in place and cannot be individually replaced. The contact kit includes a stationary contact block assembly a set of movable contacts, a set of contact springs, and a set of spring retainers. The springs and retainers should always be replaced when new contacts are installed.

**Coil replacement** - To replace coil (item 11), disconnect electrical power and remove the wiring from the coil terminals. Remove the coil jumper connecting the two coils. Remove screws (14) holding the bottom plate (13). When the bottom plate is removed, the coils will drop freely. To replace oils, reverse the procedure. The bottom plate must engage the locating nibs on the base before the screws are installed.

**Adjustment instructions** - If the solenoid armature is removed, it should be adjusted when reassembled by screwing the armature (7) to within 19/64" of the magnet core and locked with slotted nut (9) to 20 inch-pounds torque.

## PROCEDURE FOR REPLACING FURNAS CONTACTOR WITH SQUARE D CONTACTOR IN YALE KEL HOIST

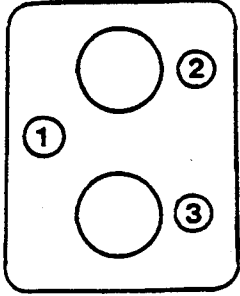

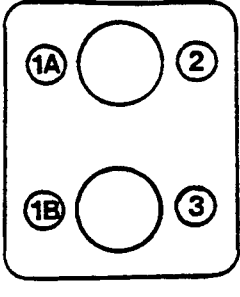

1. Remove all power from hoist. Remove hoist end cover.
2. Remove power leads, coil leads, and motor leads from both contactor and transformer. Be sure to identify these wires as they are disconnected.
3. Remove screws holding contactor and transformer to mounting plate. Discard furnas contactor, retain transformer and all hardware.
4. Remove and discard mounting plate, but retain hardware.
5. Observe gear case cover and locate two (2) angular bosses and one (1) round boss which the mounting plate had been bolted onto. These are the mounting lugs for the Square D contactor.
6. Below the contactor are four (4) round lugs arranged in a rectangular configuration. These are the mounting lugs for transformer.  
**NOTE:** The hardware we use is self tapping, therefore, the holes in the mounting lugs are not tapped for the screws. Do not allow the amount of pressure required to tighten the screws lead you to believe the screws are tight against the components you are mounting on the hoist.
7. After completion of mounting the contactor and transformer connect the wiring to the appropriate terminals and double check before applying power to the hoist.  
**NOTE:** The Square D contactor will not have any jumper wires as shipped from the parts depot. It is suggested you use the wires from the existing contactor. The numbering of the terminals on the contactors is identical so the jumper wires can be transferred directly from one contactor to the other.
8. After completing the wiring apply power to the hoist and perform a functional test of the hoist. If the hoist runs in the wrong direction, remove the power and switch any two of the three "L" leads.

## MECHANICAL INSTALLATION

### Trolley To Beam

Place the nuts on one end of the suspension bolts. Arrange the sideplates, and spacers on the bolts according to Fig. 1 and Table 1 for the proper beam size. Assemble the Trolley on beam by sliding one sideplate out far enough to allow the wheel to clear the beam flange. Draw the sideplates together, assemble the additional spacers and nuts. Tighten nuts to 175 ft/lbs. torque.

**⚠ WARNING:** Deviation from washer adjustment recommendations could cause the trolley to fall from the beam. The trolley should be inspected periodically to assure its continued safe operation. The number of spacers indicated is nominally correct. However, due to variations in structural steel, it may be necessary to vary the number used.

THE DISTANCE BETWEEN TRACK WHEEL FLANGES SHOULD BE 1/8" TO 3/16" GREATER THAN THE WIDTH OF THE BEAM FLANGE FOR STRAIGHT RUNWAYS, AND 3/16" TO 1/4" GREATER FOR RUNWAYS THAT INCLUDE SHARP CURVES.

**When Replacement Parts Are Needed, Order Only Yale® Factory Engineered Parts**

When used on monorail with curves lightly lubricate edges of beam at curve section with grease.

FIG. 1

### ELECTRICAL INSTALLATION

Be sure all power is disconnected before starting any electrical work.

#### POWER CORD TO HOIST

A short length of power cord is installed in the trolley control box (Fig.1). Remove 4 inches of the outer jacket and strip each wire 3/8 inches. Insert the cord into the power cord entrance on the hoist. Connect the green wire to the ground lug and the line wires to the "L" terminals.

#### ⚠ CAUTION:

Before connecting power to the trolley, be sure the power supply corresponds to the ratings of the trolley and of the hoist. If necessary, reconnect the trolley motor and transformer of dual voltage units according to the wiring diagram, using the terminals and jumpers provided in the field wiring kit.

A three phase motor can rotate in either direction depending on its connection to the power line. If the direction of hook travel of a three phase hoist does not match the push

# Yale® Hoists

button markings, interchange any two of the line wires at the terminal strip. **DO NOT** rewire the push button.

## PENDANT LENGTH CHANGE

If it is necessary to lengthen the pendant, the cord and strain relief cable must be replaced. The necessary parts can be obtained from your Yale dealer or service center. Use the old cord as a guide for cutting and installing the new cord. Be sure to observe the correct color code of the wires. The pendant cord must be slightly longer than the strain relief cable to prevent strain on the electrical wires and connections.

The pendant can be shortened simply by loosening the clamp on the strain relief cable at the control box, and shortening the strain relief cable. The pendant cord need not be shortened unless the extra slack in the cord causes interference with moving parts. If it is necessary to shorten the cord, be sure to observe the correct color code when reconnecting the wires.

## DUAL CONTROL STATION ASSEMBLY

If desired, the two button control stations furnished with the Trolley and Hoist can be joined into a single rigid unit, as shown in Fig. 2, using the bracket furnished with the Trolley.

PUSH BUTTON  
FIGURE 2

To install the bracket, loosen the clamping nut on cord fitting on hoist push button station. Unscrew the fitting from the station and slide it up the cord a few inches. Locate the bracket so that it will be locked in place by the suspension bracket. Replace the fitting in the station and tighten it on the cord.

## FOR TROLLEYS FURNISHED WITH 4 BUTTON STATIONS:

Cut the hoist push button cord 42 inches from the bottom of the hoist. Remove and discard the strain relief rope. Remove 4 inches of the outer jacket and strip each wire 3/8 inches. Install the cord in the trolley control box as shown in Figure 3. Connect the green wire to the ground lug, the red wire to terminal (15), the blue wire to terminal (H6) and the black wire to terminal (L). For two speed hoist only, connect the orange wire to terminal (28) and the blue wire to terminal (29).

## OPERATING AND SAFETY PROCEDURES

Immediately after installation, operate trolley according to the operating and safety procedures as follows, with a capacity load over the entire length of runway or monorail system to be sure that all adjustments and operations are satisfactory.

Rail stops must be installed for all trolleys operating on open end beams. These stops must be positioned to exert impact force on the trolley side frames only.

When preparing to lift a load, be sure that the attachments to the hook are firmly seated in hook saddle. Avoid off center loading of any kind, especially loading on the point of hook.

When lifting, raise the load only enough to clear the floor or support and check to be sure that the attachments to hook and load are firmly seated. Continue lift only after you are assured the load is free of all obstructions.

When applying a load, it should be directly under the trolley. Avoid off center loading of any kind.

Take up slack load chain carefully and start load easily to avoid shock and jerking of hoist load chain. If there is any evidence of overloading, immediately lower the load and remove the excess load.

Do not allow the load to swing or twist while hoisting.

Anticipate the stopping point and allow trolley to coast to a smooth stop. Reversing or "plugging" to stop trolley causes overheating of motor and swaying of load.

**When Replacement Parts Are Needed, Order Only Yale® Factory Engineered Parts**

Do not load trolley beyond the rated capacity. Overload can cause immediate failure of some load carrying part or create a defect causing future failure at less than rated capacity..

Do not use this or any other overhead materials handling equipment for lifting or transporting persons.

Stand clear of all loads and avoid moving a load over the heads of other personnel. Warn personnel of your intention to move a load in their area.

Do not leave the load suspended in the air unattended.

Do not wrap the load chain around the load and hook onto itself as a choker chain.

Permit only qualified personnel to operate unit.

## MAINTENANCE

To maintain continuous and satisfactory operation, a regular periodic inspection procedure must be initiated so that worn or damaged parts can be replaced before they become unsafe. The frequency of inspection must be determined by the individual application.

The following list gives an inspection procedure for normal usage under normal conditions. When the unit is subjected to heavy usage or dusty, gritty, moist or other adverse atmospheric conditions, shorter time periods must be assigned. Inspection must be made of all parts for unusual wear, corrosion or damage in addition to those specifically mentioned in the schedule below.

# Yale® Hoists

It is suggested that the unit be inspected monthly for wear damage and corrosion effects to all parts with particular attention to the following:

All fasteners including track wheel axle nuts, and suspension bolt nuts.

Contactor and control station for burnt or pitted contacts and loose or corroded terminals.

Cable and leads for broken wires, loose or corroded terminals, also damaged insulation.

Terminal board for loose or corroded connections.

Track wheels for wear of tread and flange and for bearing wear indicated by excessive looseness of wheel on axle.

Trackwheel gear and pinion for wear.

Collector or power supply system for damage, wear, corrosion and proper operation.

Once a month lubricate trackwheel gear and pinion with Texaco Novatex No. 2 or an equivalent heavy cup grease or graphite grease.

Motor gear box oil must be changed after first 100 hours of operation, then every six months or 2500 hours of normal service, whichever comes first. Use 1/2 pint of Omala Oil Grade 37 (product of Shell Oil Co.) for each oil change.

All other trolley parts are lubricated for life at the factory.

### ADJUSTMENT

WEAR ADJUSTMENT  
SCREW

### ADJUSTMENT:

1. Remove Housing.
2. Turn both adjusting screws equal amounts. Approximately 1/8 turn clockwise until proper solenoid gap is attained. AIR GAP SHOULD BE APPROXIMATELY 13/32 INCH.
3. Maximum torque may be obtained after operating brake several times. Then turning adjusting screws very slightly either way and noting which position of fine adjustment provides satisfactory stopping without changing solenoid gap.
4. On brakes with manual release knob or button integral with housing, turn housing so knob assembly is about 20 degrees to left of vertical centerline. After mating with endplate rotate housing to right to align with mounting studs. In other models, mount and attach.

## REVERSING CONTACTOR Type LC2D1210

649275601 Complete contactor with 24 volt coils  
649275602 Complete contactor with 115 volt coils

647028611 24 volt replacement coil  
647028602 115 volt replacement coil

### COIL REPLACEMENT

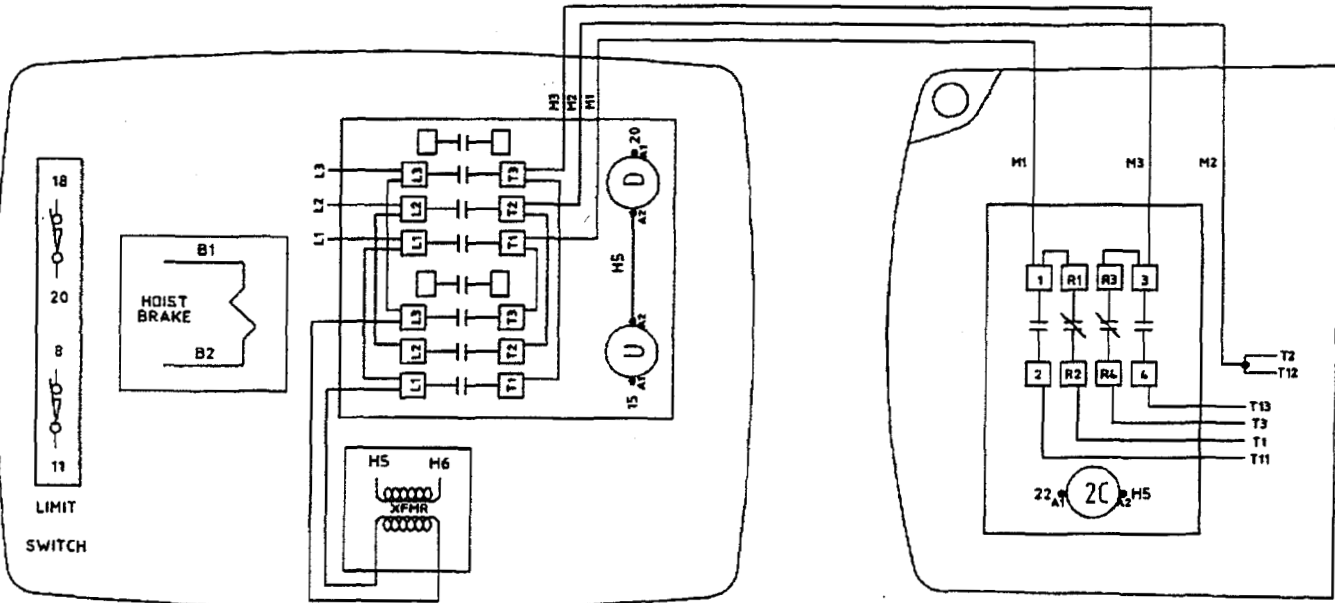

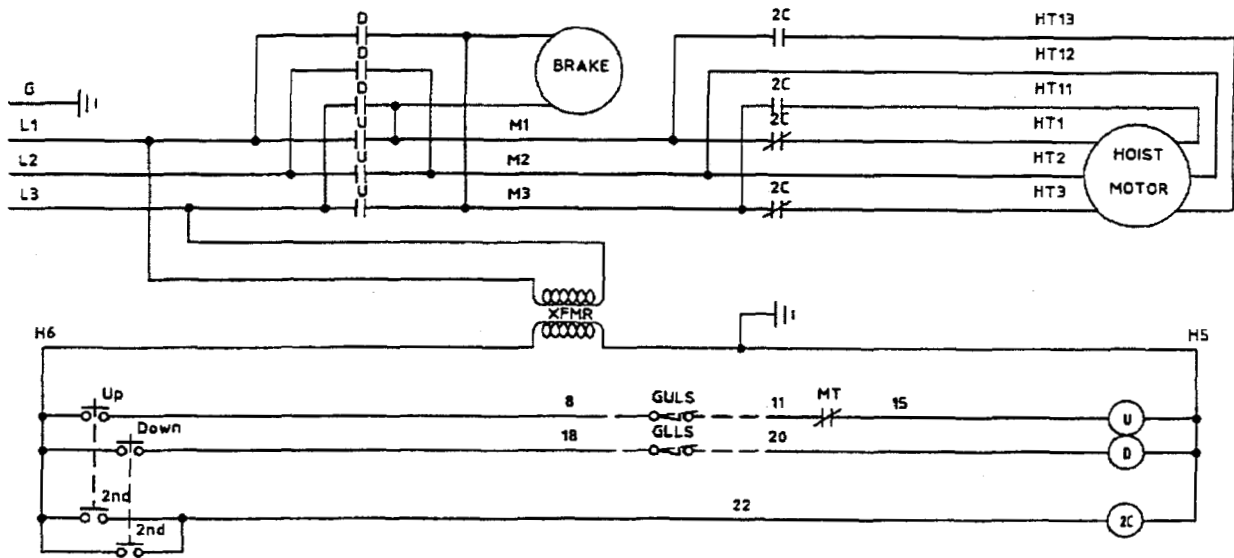

Disconnect all electrical power from the equipment and remove the wiring from the coil terminals. Note that the "A2" coil terminal appears on both sides of the contactor and may have connections on either or both sides. Mark the wires if necessary to ensure that they are replaced on the correct terminals.

Loosen the screws holding the top half of the contactor to the base. These screws are adjacent to the "A2" coil terminals and may be identified by a dark gray finish. Lift the top section from the base. If there is insufficient slack in the power wiring, it may be necessary to disconnect the wiring at this time. Be sure to mark any wires that are disconnected to ensure proper reconnection.

Inspect the contactor carefully. If any parts are worn or broken, the complete contactor should be replaced.

Lift the coils from the base. Drop the new coils into position, replace the upper section of the contactor, and tighten the screws to 1.1-1.4 Nm (10-12 lb-in). Reconnect all wiring that was removed during the disassembly process. Tighten the terminal screws to 1.2 Nm (10 lb-in).
